Elucidation of the Cross-Reactive Immunoglobulin M Response to Human Herpesviruses 6 and 7 on the Basis of Neutralizing Antibodies

Mariko Yoshida, Sadayoshi Torigoe, and Masao Yamada

Department of Virology, Okayama University Graduate School of Medicine and Dentistry, Okayama, and Yokkaichi Social Insurance Hospital, Mie, Japan

Influence of Specimen Age and Use of Different Negative Controls in Determination of Intracytoplasmic Levels of Cytokines after Whole-Blood Culture Assay

Christian Schultz, Christina Rott, Petra Temming, Julia von Puttkammer, and Peter Bucsky

Department of Pediatrics, Medical University of Lübeck, Lübeck, Germany

Volume 9, no. 2, p. 295–298, 2002. Page 297, column 1: line 7 from bottom and below should read as follows. “The greatest mean difference was seen for IL-8, with a 44.9% higher amount of IL-8 positive monocytes (95% CI, 33.7% to 56%; \( P < 0.0001 \)) compared to the purified antibody-blocking control, followed by a 29% higher amount of IL-6-positive cells (95% CI, 16.7% to 41.3%; \( P < 0.0001 \)), a 19.4% higher amount of IFN-\( \gamma \)-positive cells (95% CI, 14.3% to 24.6%; \( P < 0.0001 \)), and a 14.5% higher amount of IL-2 positive cells (95% CI, 10.7% to 18.2%; \( P < 0.0001 \)).”

Page 297, column 2: line 10 from bottom and below should read as follows. “...then the number of IL-6 positive monocytes was 69.3% higher (95% CI, 37.8% to 100.7%; \( P < 0.0001 \)) than that obtained with the purified antibody-blocking control, followed by a 26.9% higher amount of IFN-\( \lambda \)-positive lymphocytes (95% CI, 20.9% to 32.8%; \( P < 0.0001 \)) and a 18.8% higher amount of IL-2-positive lymphocytes (95% CI, 13.7% to 24%; \( P < 0.0001 \)). In the determination of IL-8, 6 values were below and 14 values above those of the purified antibody-blocking control (18.7%; 95% CI, 14.5% to 22.9%; \( P < 0.05 \)).”
